Organizes
IN-HOUSE SKILL DEVELOPMENT PROGRAM UNDER IQAC
On
SCIENCE COMMUNICATION
(5th, 12th, 19th, 26th and 28th Nov. 2022, 10am-4pm)
In Collaboration with Sansriti Foundation, Delhi

Topics Covered:

- Science communication: Scope and relevance
- Research Methodology and Design
- Ethics, plagiarism and other forms of scientific misconduct in science communication
- Tools and techniques of scientific writing (hands on)
- Tools and techniques of oral presentation (hands on)
- Planning a career as a science communicator

Resource Persons:

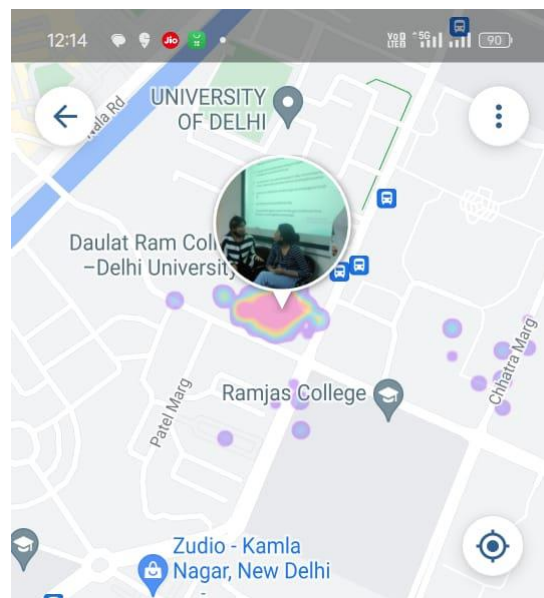

1. Prof. Padmshree Mudgal, (Prof. Biochemistry Department)
2. Dr. Adita Joshi, Director, Sansriti Foundation, Delhi
3. Dr. Radhika Gupta (Asst. Prof. Biochem. Deptt.)
3. Dr. Neeraj Dohare (Asst. Prof. Biochem. Deptt.)
4. Dr. Narendra Kumar (Asst. Prof. Biochem. Deptt.)

Abstract

The increasing prevalence of anxiety and stress-related disorders has made it a leading contributor to the global health burden. The present treatment options have severe side effects and show remission on discontinuation of the medication. Hence, there is an urgent need to explore safer alternative treatments for long-term usage with minimum toxicity. The medicinal plant *Brahmi* (*Bacopa monnieri*) has been used in Indian traditional medicine as a neural tonic for centuries. The present study aimed to study the toxicity and anxiolytic activity of *Brahmi* using the zebrafish model system. The toxicity assays determined the minimum effective concentration of *Brahmi* to be 0.01%. In addition, behavioral assays such as thigmotaxis and scototaxis and endocrine assays such as the measurement of cortisol levels in stressed zebrafish larvae were performed. Zebrafish embryos exposed to 0.2% *Brahmi* up to seven days post fertilization (dpf) did not show any developmental toxicity. Behavioral and endocrine assays were performed on 5dpf zebrafish larvae treated with 0.01% *Brahmi* extract. Our studies show that *Brahmi* significantly reduced thigmotaxis (wall hugging) and scototaxis behavior in zebrafish larvae exposed to osmotic stress as compared to untreated stressed larvae. Stress activates the hypothalamic-pituitary-interrenal axis and stimulates the release of cortisol in zebrafish larvae. Whole body cortisol assay has shown that *Brahmi* significantly reduced the stress-induced release of cortisol in zebrafish larvae. Our studies report that *Brahmi* mitigates the stress response in zebrafish larvae and has minimum toxicity. This suggests that *Brahmi* may be a safe option for long term management of stress.

Keywords: Cortisol, HPI Axis, Scototaxis, Stress, Thigmotaxis

1. Introduction

Anxiety disorders and depression are becoming leading contributors to the global health burden. COVID-19 pandemic has further exacerbated the scale and burden of mental health problems with an increase of 25% globally with women and young people being hit the worst^{1,2}. Anxiety disorders are comorbid and are often diagnosed together with depression, mood disorders, bipolar disorders, and substance abuse³, which can lead to significant impairment of general well-being and impact normal day-to-day functioning. The first line of drugs for these disorders is selective serotonin-norepinephrine reuptake inhibitors. Other treatment options include

tricyclic antidepressants, mixed antidepressants (e.g., mirtazapine), antipsychotics, antihistamines (e.g., hydroxyzine), alpha- and beta-adrenergic medications (e.g., propranolol, clonidine), and GABAergic medications (benzodiazepines, pregabalin, and gabapentin)^{4,5}. Most of these drugs are addictive, have severe side effects such as sedation, a decrease in cognitive ability, and hence are not recommended for long-term use⁶. A high relapse rate is observed in patients when treatment is stopped. An increased risk for suicidal ideation (not suicides) in children and adolescents has been reported in cases treated with antidepressants such as escitalopram, citalopram, paroxetine, sertraline, mirtazapine, and venlafaxine⁷. Popular anxiolytic drugs like Alprazolam have also been

The screenshot shows a Google Meet window with a presentation slide titled "Multivariate analysis of variance (MANOVA)". The slide contains the following text:

Multivariate analysis of variance (MANOVA) is simply an ANOVA (Analysis of variance) with *several dependent variables*. It is a continuation of the ANOVA. In an ANOVA, we test for statistical differences on one continuous dependent variable by an independent grouping variable. The MANOVA continues this analysis by taking multiple continuous dependent variables and bundles them collectively into a weighted linear composite variable. The MANOVA compares whether or not the newly created combination varies by the different levels, or groups, of the independent variable. One can perform this MANOVA test in very easily. For example, let's conduct an experiment where we give two treatments to two groups of rats, and we are taken the weight and height of rats. In that case, the weight and height of rats are two dependent variables, and the hypothesis is that both collectively are affected by the difference in treatment. A multivariate

The meeting interface shows a grid of participants including satish verma, Dr. Jyoti Sharma, Dr. Sarita Nanda, 19014510033 KAN..., Seema Khurana, 19014528028 PRAT..., and 32 others. The time is 11:27 AM on 28-12-2021.
